ABOUT THIS CONCEPT

A concept for the Medidata Knowledge Hub

This document presents an early design concept for the Medidata Knowledge Hub — the home for technical documentation, release news and product guidance that will succeed the retiring Zoomin experience.

Rather than describe our thinking in the abstract, we designed a concrete direction you can see and react to. The three templates that follow — home, article and search — are design mock-ups, styled in Medidata's own brand system so the direction feels real rather than abstract. Nothing here is final; it is a starting point, shared to align on direction before anything is built.

Why DiscoverCX by Ingeniux

These mock-ups illustrate a Hub delivered on DiscoverCX by Ingeniux, a content platform purpose-built for large, structured technical documentation. DiscoverCX handles authoring, publication, versioning, search and governance. Once the design direction is locked in, we implement this concept on the platform — so the direction you approve here carries straight through to the built Hub.

OUR APPROACH

Five principles behind the design

Brand-faithful

The Hub adopts Medidata’s existing web language — the navy and Medidata Blue palette, the Roboto family, the lime accent, and the menu and button patterns from medidata.com — so it reads as part of your ecosystem, not a vendor skin.

Organized around your products

The home page leads with “Browse by product” and a task-based “Explore the Hub,” mirroring how customers actually look for answers. The right documentation is a click or two away — whether people think in products or in the job they’re trying to get done.

Search-first

A prominent search bar anchors the hero, and results are faceted by product, content type, language and recency — because most documentation journeys begin with a query, not a menu.

Accessible by default

The design targets WCAG 2.1 AA: verified color contrast, visible focus states, full keyboard navigation, semantic landmarks and reduced-motion support are built in, not bolted on.

Considered and consistent

A shared component system — cards, buttons, callouts, tables and navigation — with careful typography and spacing keeps the Hub cohesive as it grows across products and content types.

VISUAL SYSTEM

Color, type & logo

Color palette

					
Navy #0E2148 Primary / headers	Medidata Blue #005DAA Actions / links	Lime #BFCE2A Accent	Ink #1F2937 Body text	Slate #475569 Secondary text	Cloud #F5F7FA Surfaces

Drawn directly from medidata.com. Navy anchors headers and primary surfaces; Medidata Blue carries actions and links; lime is used sparingly as an accent line and highlight.

Typography — Roboto

Aa Display — Black 900

Aa Heading — Bold 700

Aa Subhead — Medium 500

Aa Body — Regular 400 · The quick brown fox jumps.

Aa Light 300 — used for large intros and quiet captions.

Roboto is Medidata’s web typeface. A clear weight hierarchy — Black for display, Bold for headings, Medium for subheads, Regular for body — keeps long technical pages scannable.

Logo lockup

Your official vector logo is used unmodified, paired with “Knowledge Hub” set in live text and a hairline divider — matching the portal lockup and keeping the mark crisp at any size.

COMPONENTS & INTERACTION

A shared component language

Buttons

8 px radius · hover lifts 1 px · focus ring: 2 px Medidata Blue @ 2 px offset

Cards

Two card types share one system. **Product cards** use a navy-to-blue gradient header with the product name, iMedidata pill and a lime accent line. **Section cards** use a quarter-height image header with a title and subtitle. Both lift subtly on hover and share the same radius, shadow token and focus ring.

Navigation

A glassmorphic sticky header solidifies on scroll for contrast, and **auto-hides on scroll-down and reappears on scroll-up** to maximize reading space. A Products mega-menu mirrors the medidata.com menu behavior.

ACCESSIBILITY

Built to WCAG 2.1 AA

Color contrast

Text and interactive elements meet AA ratios; footer and overlay text were tuned to pass on navy and photographic backgrounds.

Visible focus

Every link, button and card shows a 2 px Medidata Blue focus ring with offset for keyboard users.

Keyboard & semantics

Full keyboard navigation, a skip-to-content link, semantic landmarks and ARIA labelling on icons and controls.

Motion

Animations are subtle and respect the operating-system “reduce motion” preference, disabling non-essential transitions.

TEMPLATE

Home

The landing experience

On this page

- Photographic hero behind a navy gradient with prominent search
- “Browse by product” grid of product cards (Rave EDC, RTSM, Detect, and more)
- “Explore the Hub” section cards with image headers
- Support band and full footer in brand navy

TEMPLATE

Article / reader

Reading a document

On this page

- Left document tree for in-publication navigation
- Focused article column with headings, callouts, code and tables
- Right rail: page actions (PDF, share, watch, save) and an “On this page” table of contents
- “Was this helpful?” feedback and previous / next links

Overview

Before you begin

Create an edit check

Edit check types

Example: range-check

Test your edit checks

Best practices

Design vs. production

Design vs. production

Edit checks you add or change apply only after the study design is migrated to the production environment. Test thoroughly in your sandbox first.

Before you begin

- You have the **Study Designer** role for the study.
- The target fields already exist on the relevant forms.
- You know which action the check should take – raise a query, mark non-conformant, or open a form.

Create an edit check

Open **Architect** and select your study, then choose **Edit Checks**.

Select **Add Edit Check** and give it a clear, unique name.

Add one or more **check steps** defining the fields and the condition to evaluate.

Add the **check action** – for example, open a query with your query text.

Save, then validate the check against test data before migrating.

Tip

Name checks by field and intent (e.g., SYSBP_RANGE_H20H) so they are easy to find and audit later.

Edit check types

Type	Purpose	Example
Range	Value must fall within expected limits	Systolic BP between 60 and 250 mmHg
Required	A field must be completed	Visit date is not blank
Consistency	Two or more fields must agree	End date is on or after start date
Format	Value matches an expected pattern	Lab units match the reference set
Protocol	Flags a protocol deviation	Dose exceeds the protocol maximum

Example: range check

A simple range check on a systolic blood-pressure field that opens a query when the value is outside the expected window:

```
# Edit check: SYSBP_RANGE_H20H
WHEN SYSBP IS NOT NULL AND ( SYSBP < 60 OR SYSBP > 250 )
THEN OPEN QUERY "Systolic BP is outside the expected range"
```

Test your edit checks

Enter representative values in the sandbox – including boundary and out-of-range cases – and confirm each check fires exactly when expected and stays silent otherwise. Review the query text as the site will see it.

Best practices

- Keep each check focused on a single rule for easier maintenance.
- Write query text that tells the site exactly what to do.
- Avoid over-checking – too many queries slow data entry and frustrate sites.
- Document the intent of complex checks for future study builders.

TEMPLATE

Search results

Finding an answer

On this page

- Navy sub-header carrying the active query
- Faceted filters: product, content type, language, last updated — with counts
- Result list with type and product badges, breadcrumb path and highlighted snippets
- Sort control and pagination

NEXT STEPS

Let's explore it together

Let's walk through it together

We'd welcome the chance to walk you and your team through the design — home, article and search — in a short working session, and gather your feedback on the direction before we begin implementation.

Happy to set up a walkthrough whenever it's convenient.

What's included

- Home, article/reader and search-results mock-ups
- Responsive layouts, designed in Medidata's brand system
- WCAG 2.1 AA accessibility built into the design

We'd love your feedback

Tell us what resonates and what you'd change, and we'll fold it into the next iteration. From there we can align on the full template set and plan a phased migration of your existing publications — preserving their URLs, search and navigation so nothing your users rely on breaks.
